Ex: 14 To capture, Save, and Analyse
07/08/26 Network traffic on TCP | UDP | IP | HTTP
| ARP | DHCP | ICMP | DNS using wireshark
tool.

AIM:

The aim of this Experiment is to capture, Save, and analyse network traffic on TCP/ UDP | IP | HTTP | ARP | DHCP | ICMP | DNS using wireshark tool

PROCEDURE:

Step 1: Download and install wireshark from its official website. Ensure you have administrator privileges for network capture.

Step 2: Launch wireshark and identify the network interface through which your device is connected to network

Step 3: Before starting the capture, apply capture filters to focus on specific Protocols & reduce unwanted data.

Step 4: click the start button to begin capturing like network traffic on the chosen interface.

Step-5: while capturing, use display filters to isolate and analyze specific protocols more easily.

Step:6 Let the capture run until you have collected enough packets for analysis. Then click the Stop Button to halt the capture process.

Step-7: Save the captured traffic by navigating to file > Save as, and choose a suitable filename format.

Step-8. Review analyse the captured packets in detail. Look for key information such as Source Destination IP Address protocol layers, packet length, & styss.

O/P:

The o/p will be as list of network packets displayed in wireshark's packet details window, which will outline.

No: Packet number in the capture sequence

Time: Timestamp when the packet was

captured

source : The source IP address of the Packet.

Destination: The destination IP address of the Packet

Protocol: The Protocol used.

length: The size of the Packet integer.

Result:

Thus the Experiment capture, Same. and analyse network specification TCP, UDP, IP, HTTP, ARP, DHCP, ICMP, DNS using wireshark tool.
